

Welcome to a new way of implementing drawing standards!

INFRACAD is a drafting software package specifically designed by Infracorp to increase drafting efficiency and provide consistency in drawing production through the provision of drafting standards customised to individual company requirements.

[Infracad](#) has been designed to operate within existing design software packages including MicroStation via unique illustrative 'pop-up' drawing menus to enhance user understanding of drawing levels.

The drawing levels are controlled via a single database that holds information relating to the level's name, colour, style and weight. The database removes the need for individual users to set level properties as users can simply 'click' on level buttons provided in the 'pop-up' drawing menus that will automatically set the level properties and provide options, if relevant, for the provision of drawing cells and text fonts.
